

BIM472 IMAGE PROCESSING**PROJECT - 2****GOAL**

- The aim of this project is to evaluate algorithms for **Optic Disc and Fovea Detection**: Automatic localization of optic disc and fovea center coordinates and also segmentation of optic disc.

REQUIREMENTS

- When an image is provided to the program, the localizations of the optic disc and fovea on the image (in terms of x and y coordinates) should be highlighted. See the example below.

- Use the "Indian Diabetic Retinopathy Image Dataset (IDRiD)" in your project by downloading it from <https://idrid.grand-challenge.org/Home/>.
- You should test your code on all the provided images and indicate success rate using F score.

$$F \text{ score} = 2 * (\text{precision} * \text{recall}) / (\text{precision} + \text{recall})$$

precision: the number of correct results divided by the number of all returned results.

recall: the number of correct results divided by the number of results that should have been returned.

- Write your report using the template provided in "BIL472_Template.doc".
- Your report should contain the image processing techniques employed in your design.
- Prepare a PowerPoint presentation for your project and present to the class.
- Archive your report, presentation, source codes; submit ESTUOYS before the deadline.
- Each group should make single submission.

TOOLS

- MS Office
- MATLAB
